

Public park in Mexico City utilizing Roasted Ash decking

## HURFORD ROASTED ASH DECKING

Hurford's Roasted Ash decking uses a heat treating process to thermally modify the cell structure of the timber to produce a product that is extremely stable & durable without the use of chemicals.

Roasted Ash decking has been used extensively throughout the world from the deserts of Mexico to the Fjord's of Scandinavia and is now available in Australia.

QUALITY KILN DRIED TIMBER

## Stability Plus

Roasted Ash decking is extremely stable with around half the movement of other kiln-dried timber decking products. This high stability also means that end matching the decking is possible.

## Chemical Free Treatment

Roasted Ash uses a thermal high temperature treatment to protect the product from fungi attack without the use of any chemicals.

## End Matched Decking

Using a specially designed end matched profile created for external use, means the decking can be joined anywhere, rather than having to dock material (creating waste) and joining on top of a joist - this translates to a saving of precious resource as well as money.

## Traditional or Secret Fixing

Roasted Ash can be fixed using the traditional method through it's face or using the unique secret fixing method developed and produced in Austria.

## Keep your deck looking good

All timbers age and change colour when used outside. To help protect against this, coating your deck with a suitable external decking finish is advisable. This will assist in maintaining and protecting your deck into the future\*

## Technical information...

Product name	Roasted Ash
Treatment	Chemical Free, Thermally modified
Width	132mm
Thickness	20mm
Profile	D31 pencil round, secret fixing, end matched
Joist Spacing	450mm

*\*Always follow the manufactures instructions when applying decking finishes - particularly around the number of coats required and the frequency of recoating to maintain the best possible finish.*
